Content

- 1. Research hypothesis**
- 2. Engendered and sustainable peace**
- 3. HUGE peace and security**
- 4. Global and contextual changes with new threats**
- 5. Regional integration**
- 6. Resource control or resource sharing**
- 7. Paradigm shift: from an occidental to a HUGE resource sharing**

1. Research Hypothesis

An engendered and sustainable peace is able to overcome the threats of thousands of years of patriarchal institutions, religious controls and totalitarian exercise of power, which have also affected natural resources and ecosystem services.

Engendered and
sustainable peace

2. Engendered & sustainable peace

The concept of an 'engendered' and 'sustainable peace' refers to the structural factors related to **long-term violence**, which are **deeply embedded in the patriarchal system and characterized by authoritarianism, exclusion, discrimination, exploitation, and violence**. This dominant social structure is **affecting values such as equity, equality, justice**, and threatens often even the **survival of individuals and social groups**. The sources of threats were consolidated during **thousands of years by patriarchal institutions, religious controls and totalitarian exercise of power, affecting also natural resources**. The links to patriarchy and its war system are related to the **physical, social and cultural threats** of the **dominant values** and behaviour prevailing in the Anthropocene.

3. HUGE peace and security

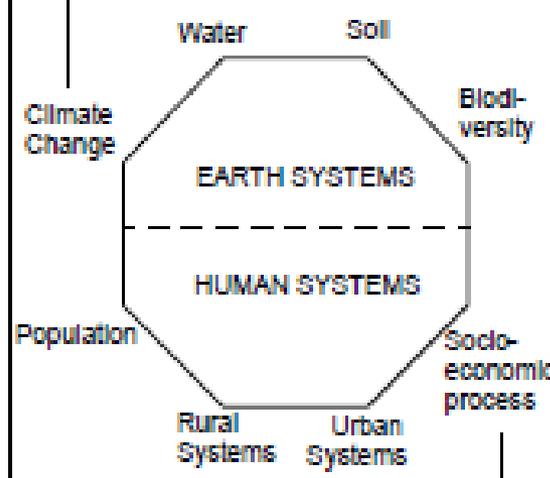

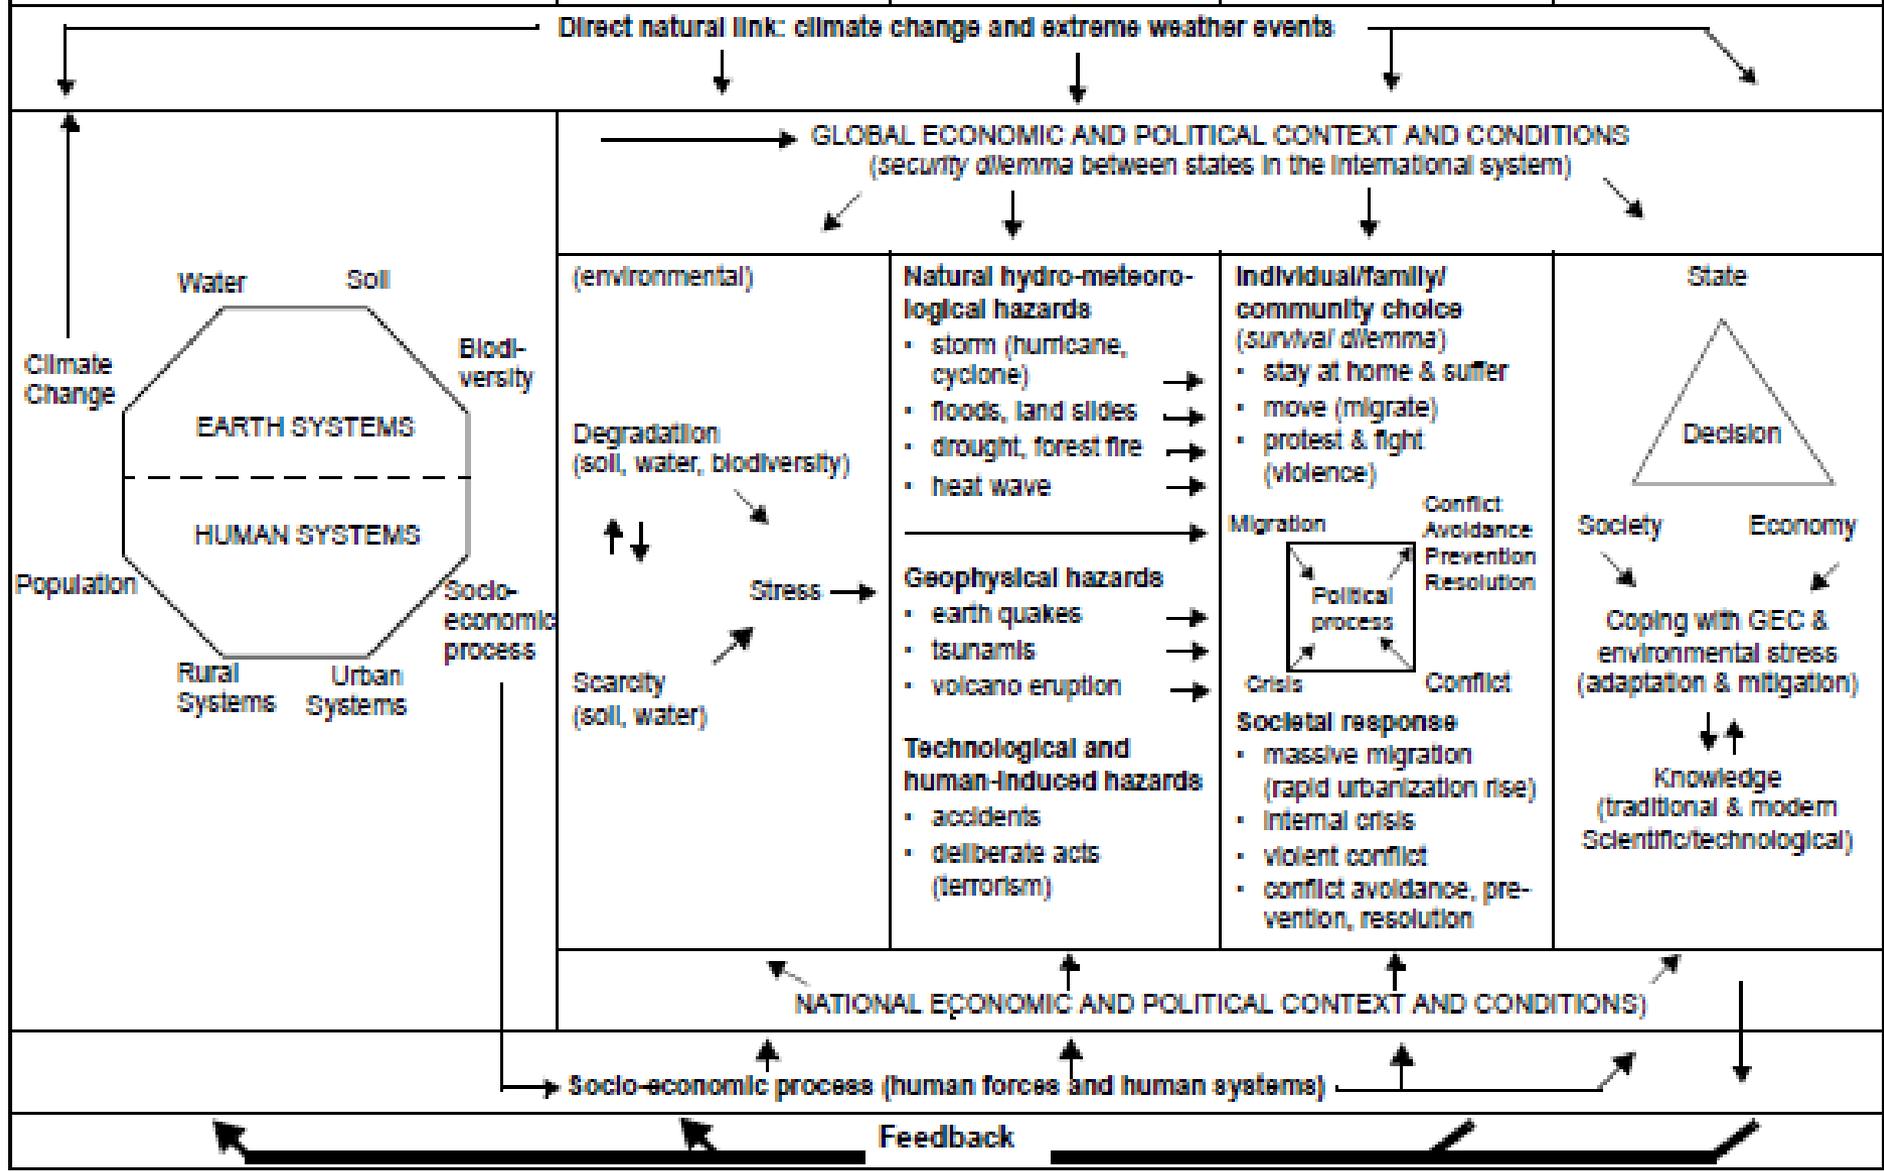

- Human, Gender and Environmental Peace & Security (HUGE) starts with a wide gender concept (vulnerable) including children, elders, indigenous and other vulnerable groups and analyzes the human-centered focus on environmental security and peace challenges. Scrutinizes the patriarchal, violent and exclusive structures within the family and society including the existing process of social representation-building and traditional role assignation between genders. Examines the consolidated women discrimination, but also some narrow feminist approaches of male-female opposition anchored (Oswald, 2001, 2004, 2006).
- 'Human security' with its four pillars searches the root causes of equity and conflict resolution, including different social organizations, specific governmental policies, private ethical investments and legal reinforcements by stimulating sociopolitical participation of women, young and elders. At the international level HUGE looks for models of free and equal access to world and regional markets without trade distortions, where further world solidarity is practiced to support the poorest countries and the most social vulnerable.

- As a holistic concept, HUGE analyses 'environmental security' with practices where a healthy environment, integral management of natural resources, prevention and remediation practices reduce vulnerability of hazard impacts also bottom-up.
- As nonviolent conflict resolution concept HUGE investigates personal and social identity in a world where processes of unification and diversification are occurring quicker than ever in the past history, and human beings have a basic necessity to simplify and to put order into complex realities through social comparison.
- Finally HUGE explores the consolidation of participatory democracy and governance, where model of conflict prevention, nonviolent conflict resolution processes and peace-building are analyzed. The examination distinguish among imposed and genuine development processes, including the relationship with the environment.

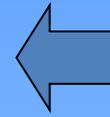

4. Global and contextual changes with new threats

Pressure	Effect	Impact	Societal Outcome	(Policy) Response
Causes of Global Environmental Change (GEC)	Socio-economic Interaction Environmental scarcity, degradation and stress	Natural and human-Induced hazards	Individual choice (survival dilemma) Societal response	National and international political process, state, societal and economic actors and knowledge

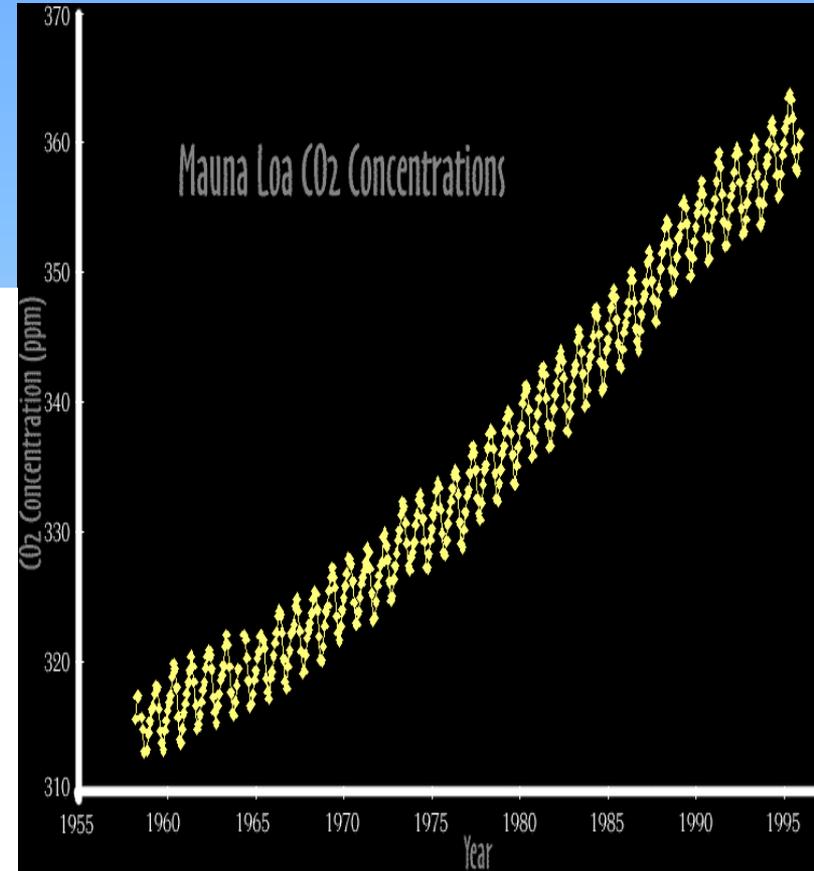

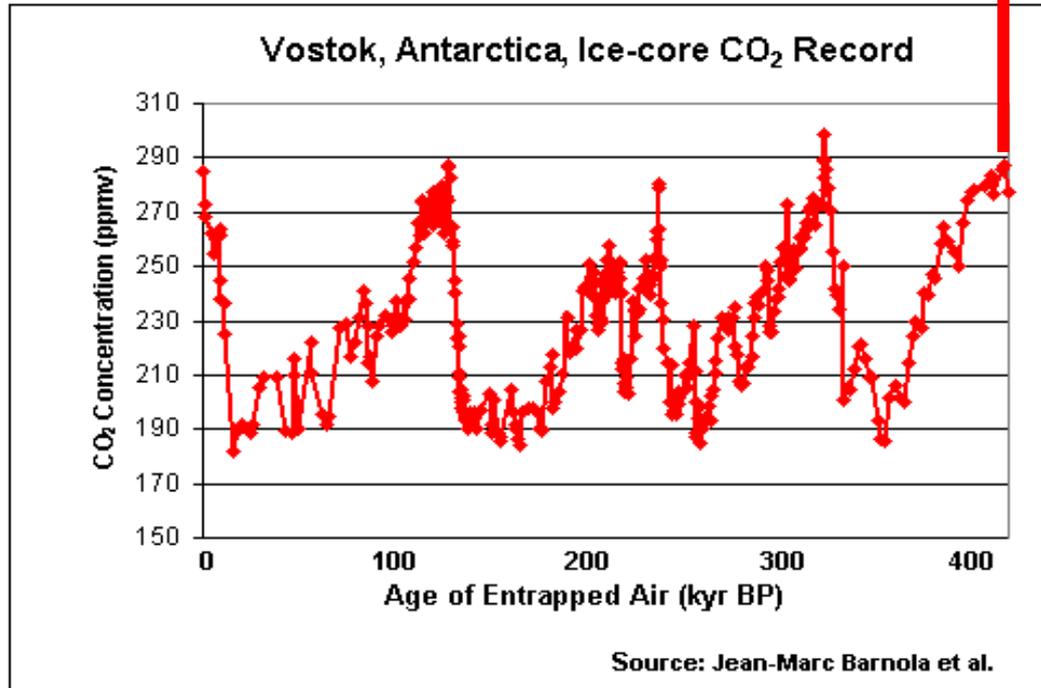

Climate change and CO₂ concentration in air

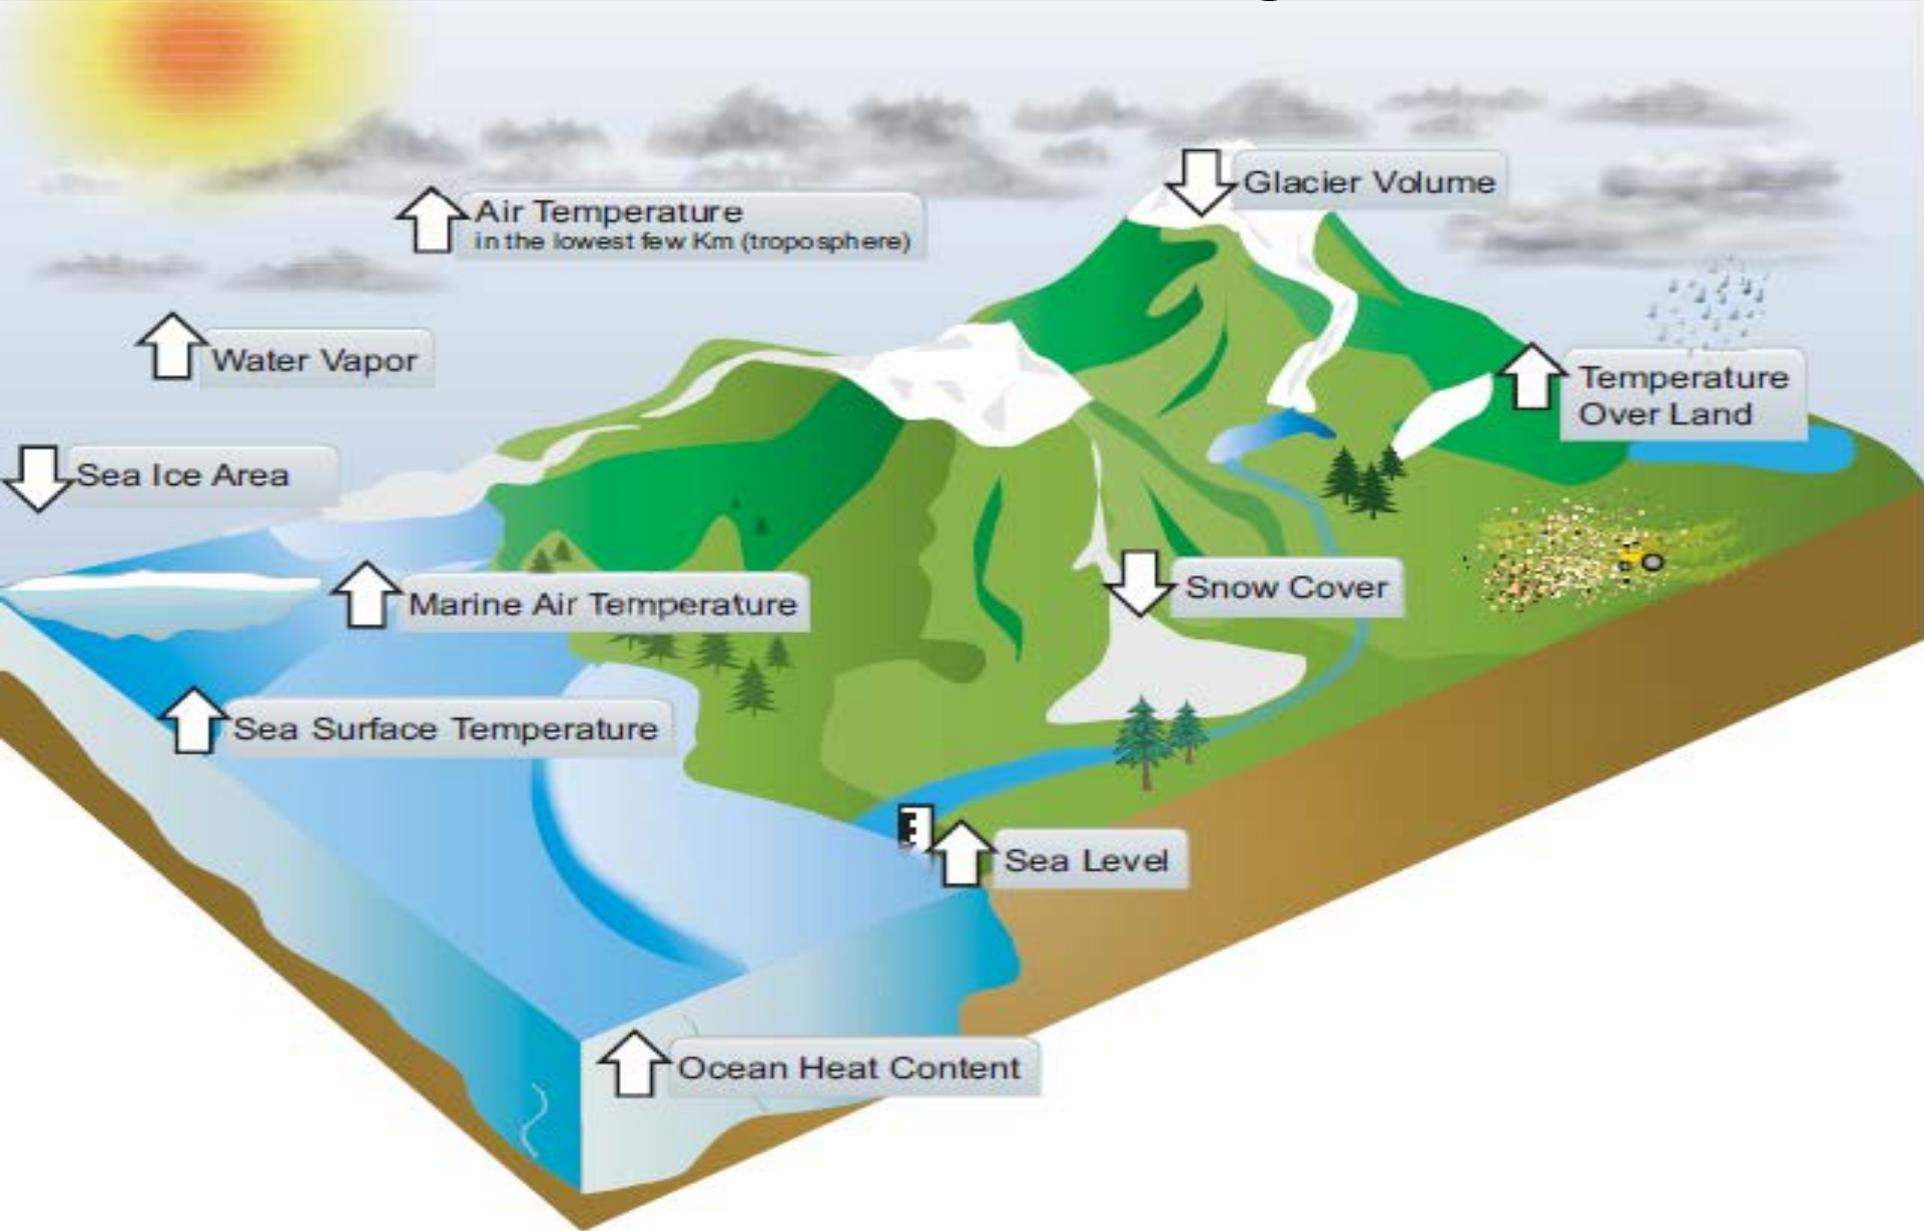

With 99% of certainty global warming in th 20. Century is produced by greenhouse gases: we human-being produce them and are also affected by the consequences. We are the threat an the victims.

| No Data | Trafficking is illegal but is still practiced |
| Trafficking is illegal and rare | Trafficking is limitedly illegal and is practiced |
| Trafficking is illegal but problems still exist | Trafficking is not illegal and is commonly practiced |

Trafficking of drugs

Source: Bourbaki Report, 2011: 15

Trafficking of arms

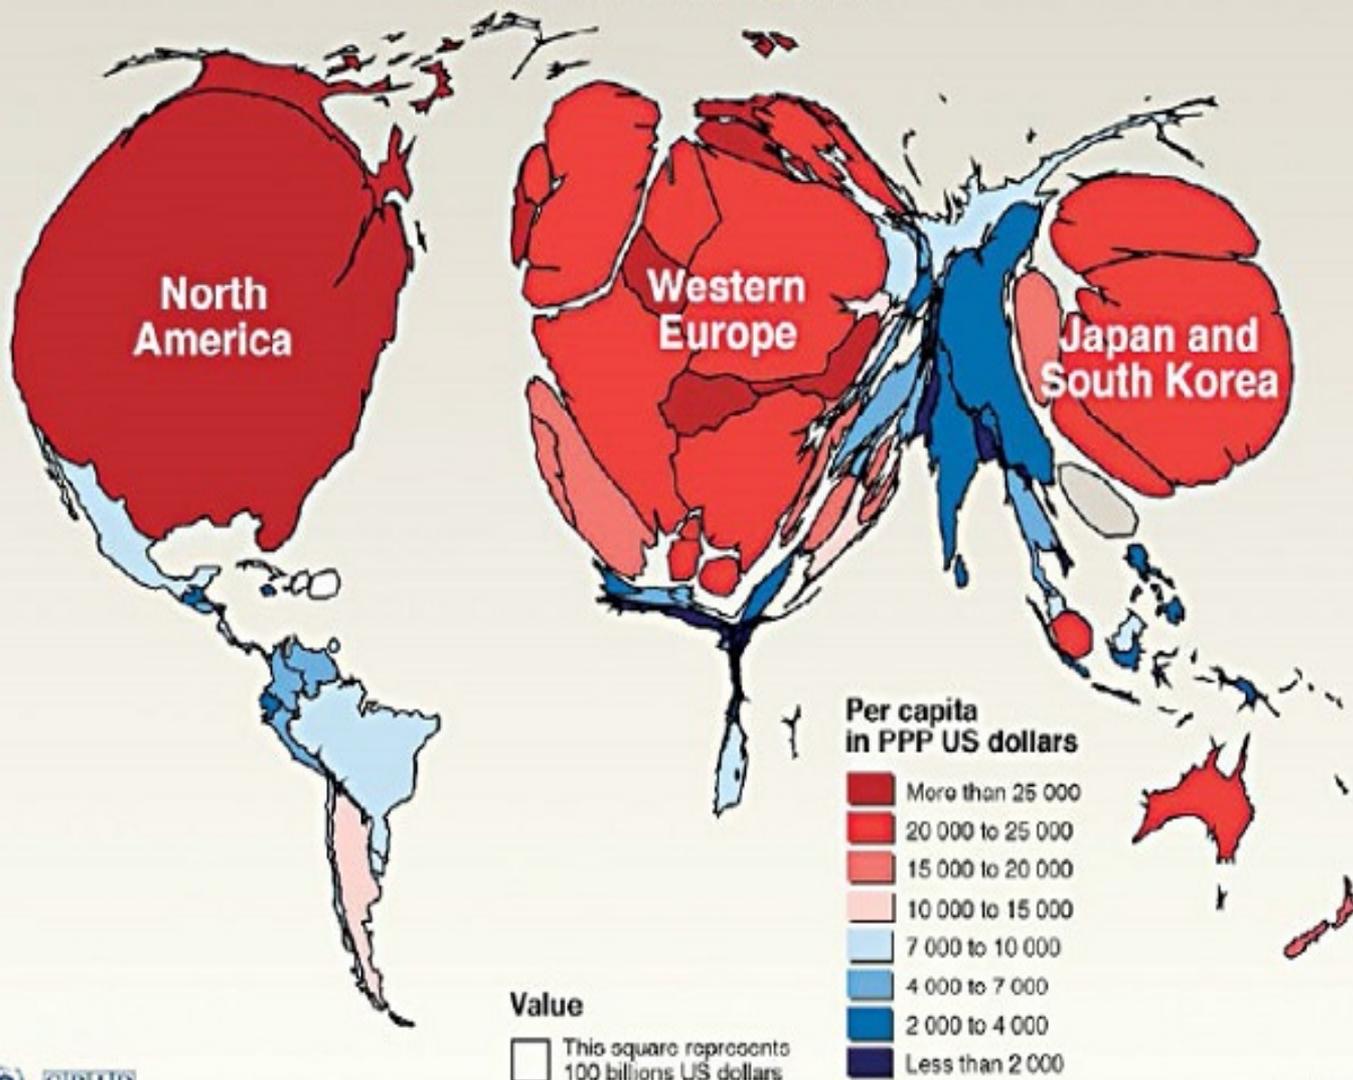

World Health Organization, between 73,000 and 90,000 people in Latin America and the Caribbean are **shot to death each year**. The gun-related homicide rate in LA exceeded the **global average in 2010 by more than 30 percent**. World Bank estimates that crime and violence cost **Central America**.

nearly 8 percent of its GDP when accounting for the costs of law enforcement, security, and health care.

- Mexican authorities intercepted **12.7 % of the roughly 250,000 guns** smuggled into Mexico between 2010 and 2012, while the **ATF intercepted no more than 2%** (OAS 2014)
- USA voted in favor of the United Nations' Arms Trade Treaty in April 2013, but has not sign or ratify the treaty. **Strengthening U.S. gun laws** will not eliminate gun violence in Latin America, where **weak judiciaries and police forces**, the proliferation of **gangs and black markets**, and **deep inequality exacerbate violent conflict**. Nonetheless, lax U.S. gun regulations **do enable international trafficking**.

6. Resource control or resource sharing?

The Real Picture

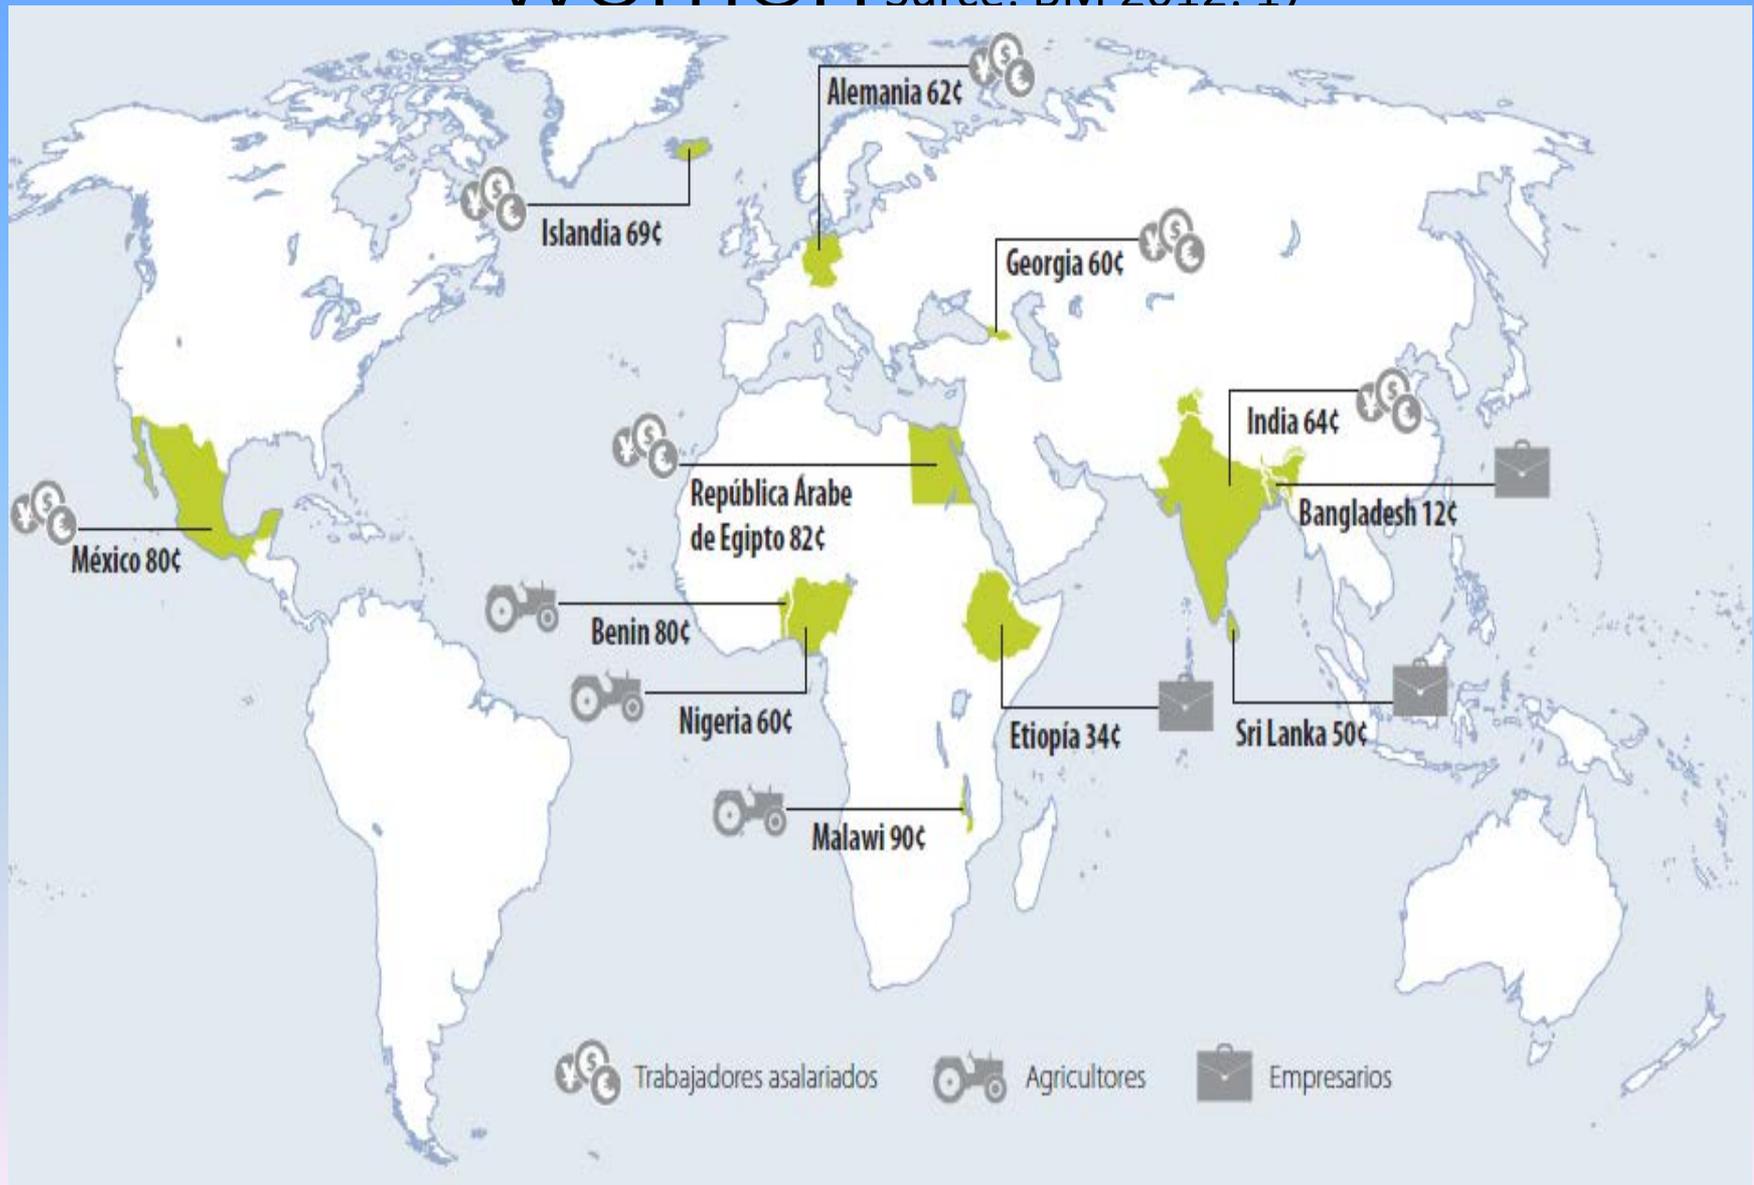

Wealth on Earth

Source: GRID, 2013

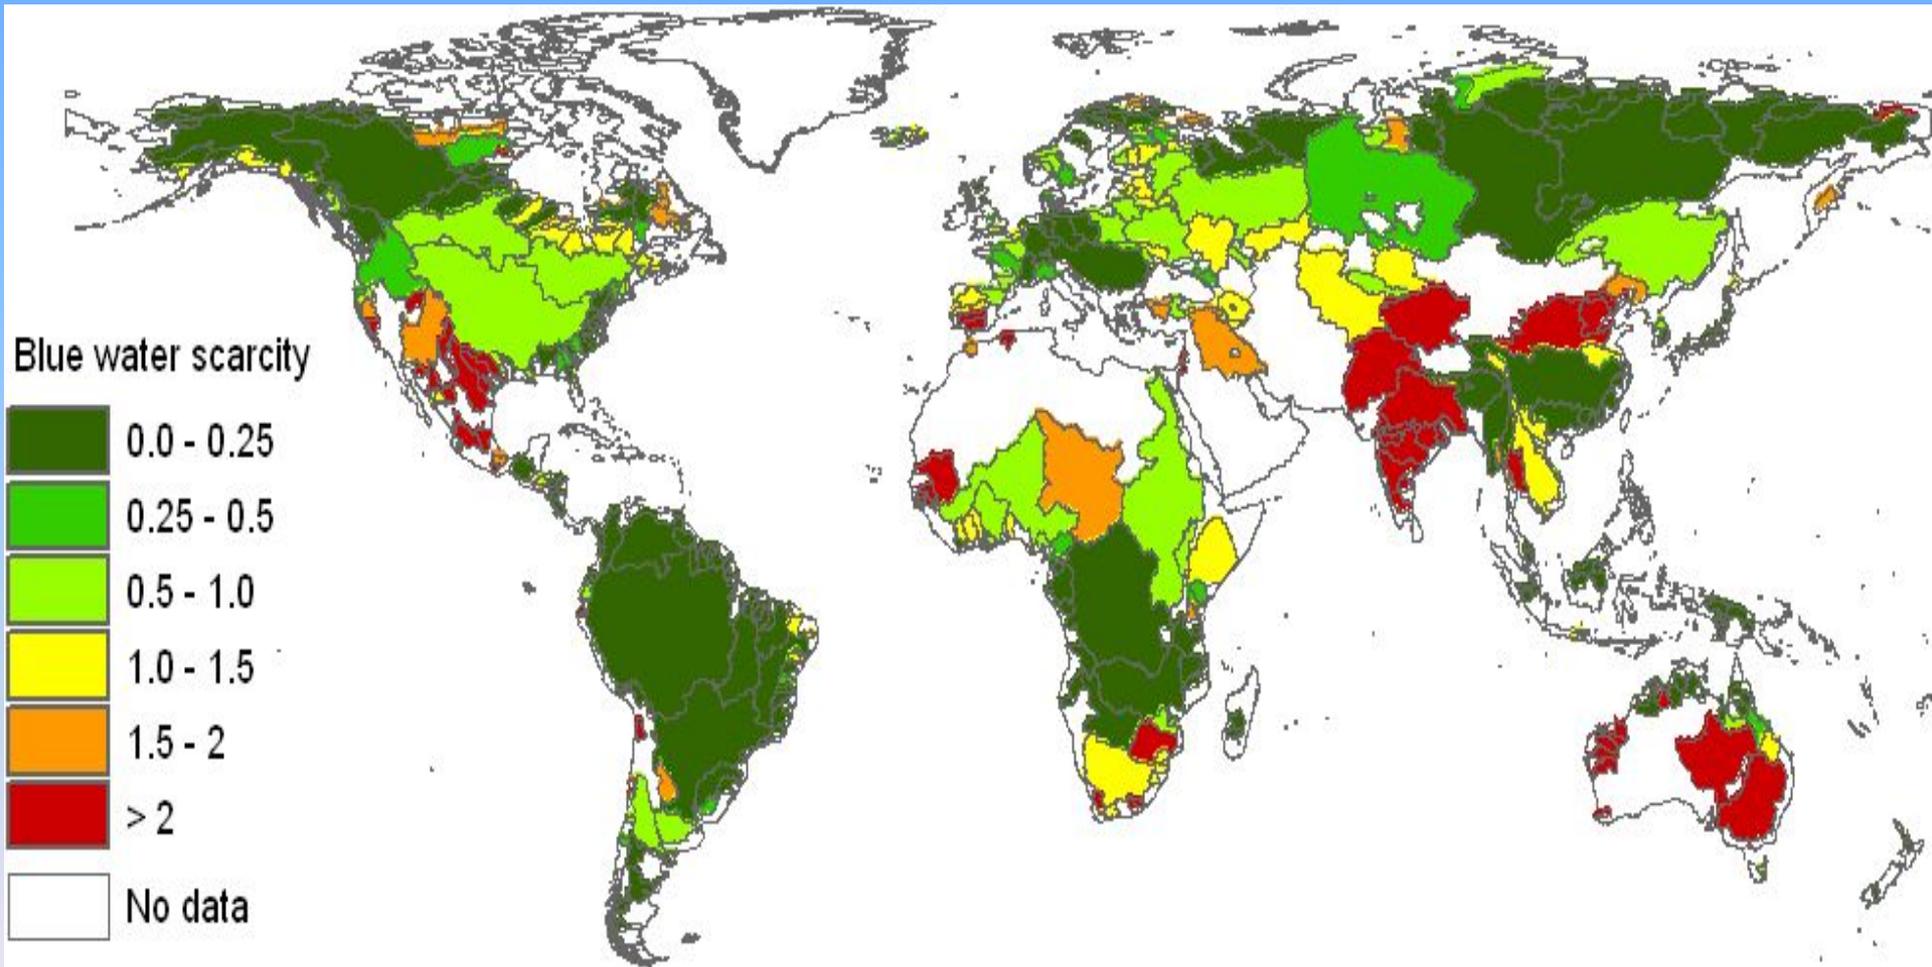

- Inequality
- Injustice
- Discrimination
- Exploitation
- Underdevelopment
- Poverty
- Illness

Income differences among men and women

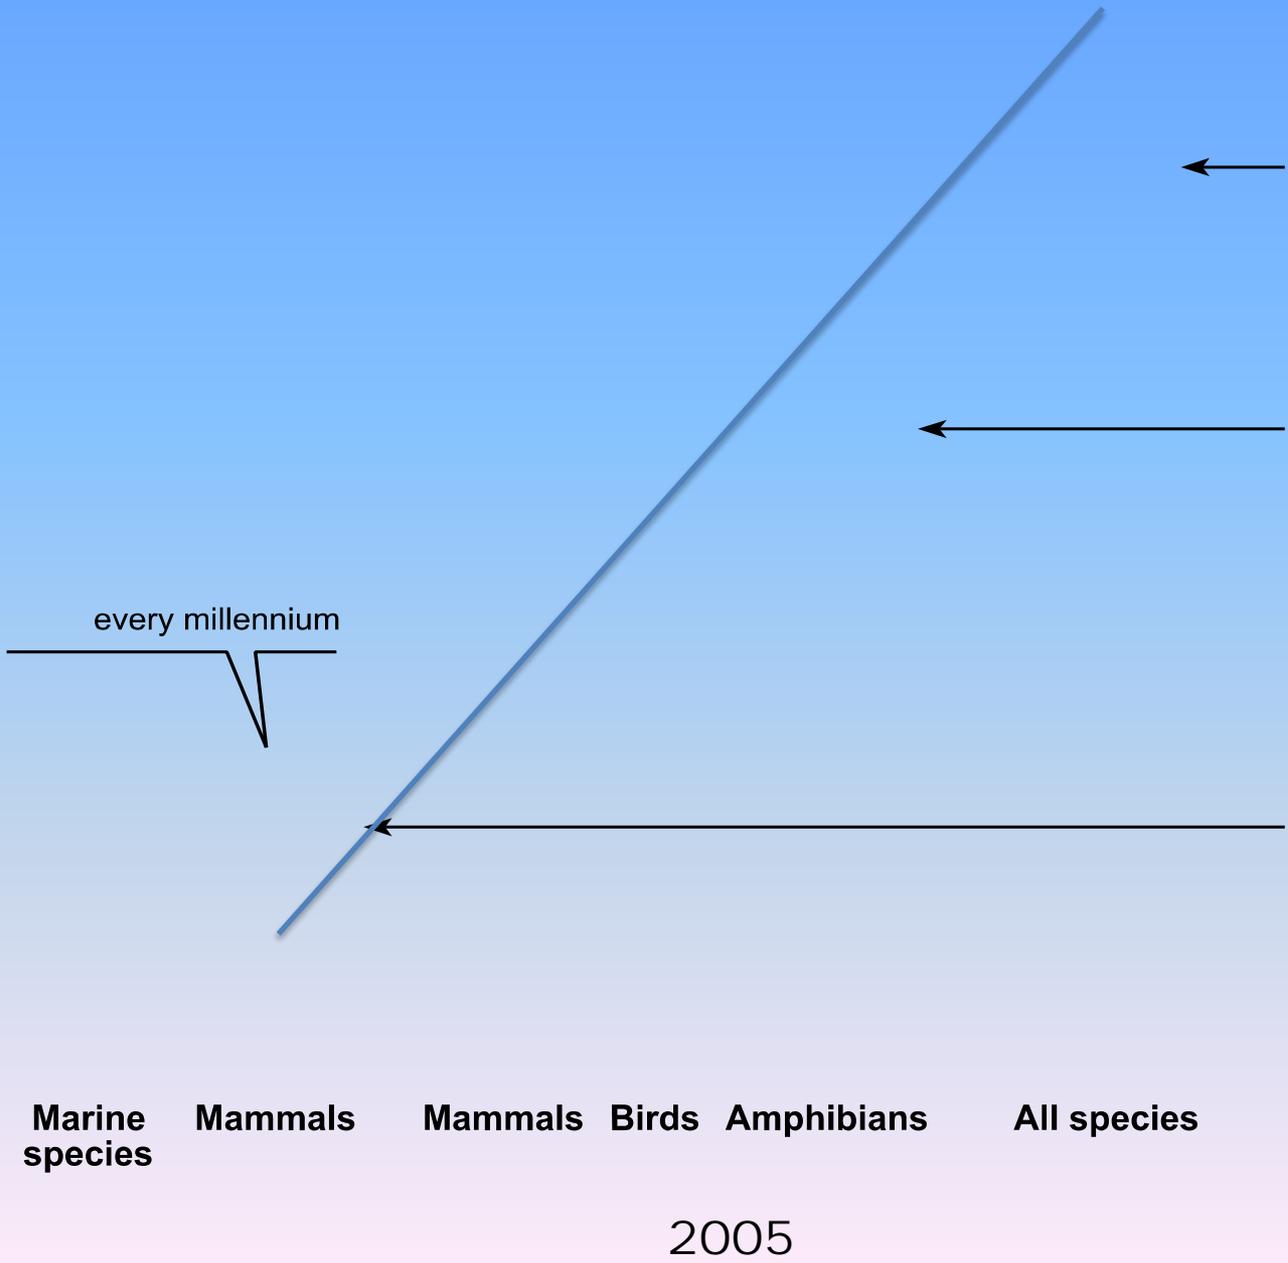

Surce: BM 2012: 17

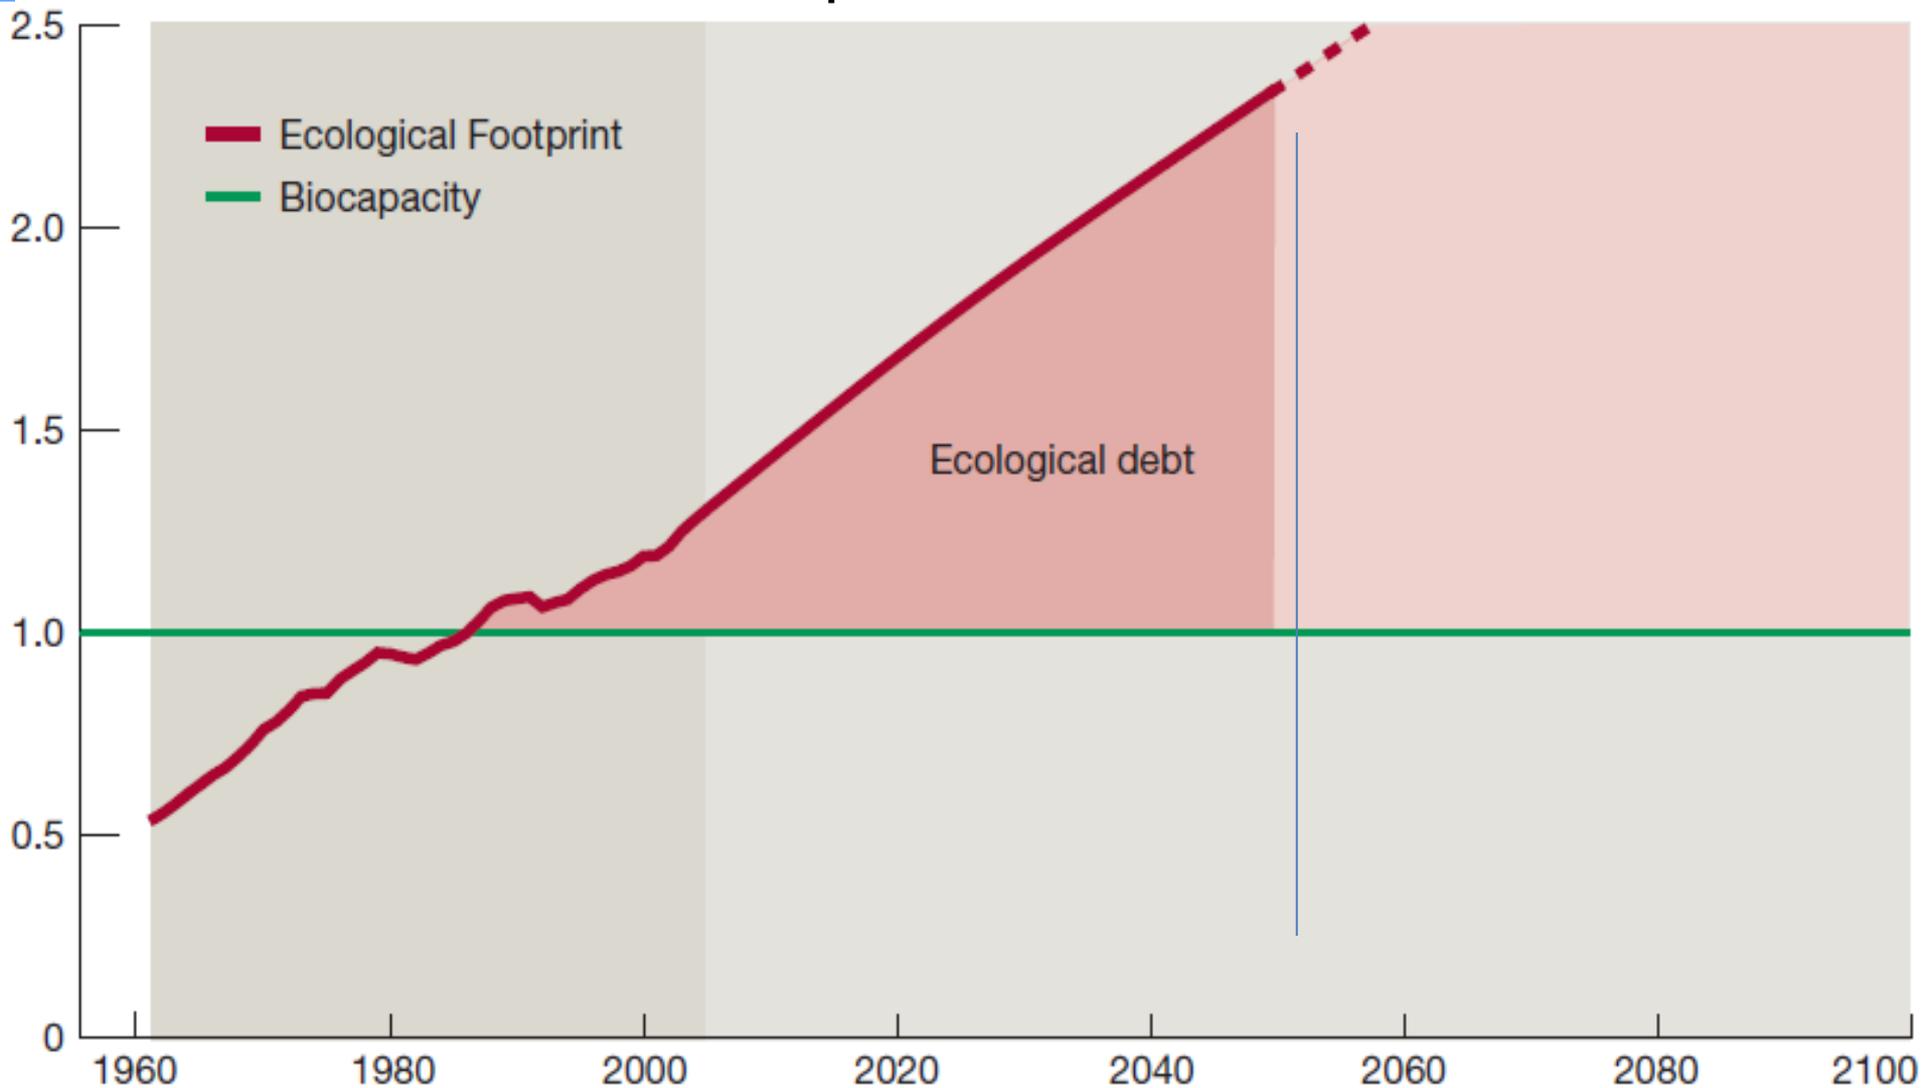

Freshwater reserve/month in the most important basins, 1996-2005

Hoekstra and Mekonnen, 2011

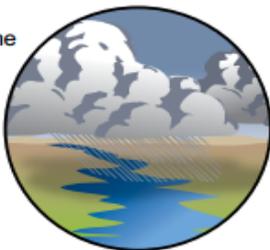

Ecological footprint: in 2050 we need 2.5 planets

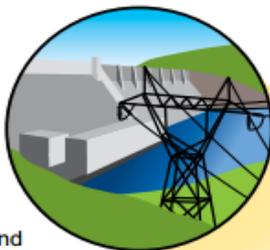

FLOODS

An increase in extreme weather will lead to higher winter river flows, runoff and flooding.

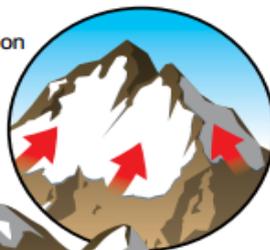

HYDROELECTRIC POWER

Changes in flow decrease clean power generation.

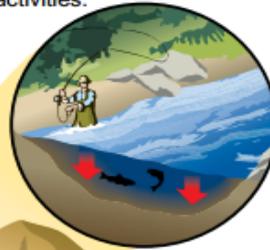

SNOWPACK

A 25% reduction of snowpack will change water supply.

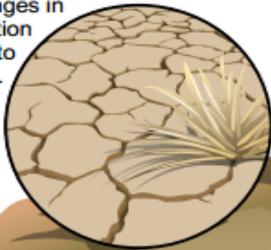

RIVER FLOW

Changes in river flow impacts water supply, water quality, fisheries, and recreation activities.

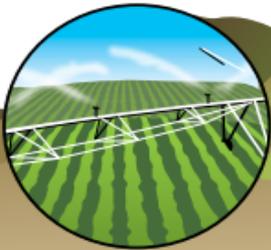

DROUGHT

Higher temperatures and changes in precipitation will lead to droughts.

AGRICULTURE

Increased demand for irrigation.

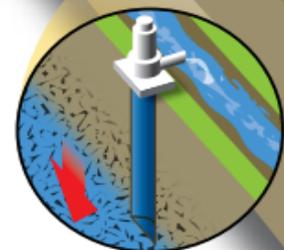

DELTA LEVELS

Sea level rise will threaten Delta levees.

HABITAT

Warmer river temperatures stress cold-water species such as salmon.

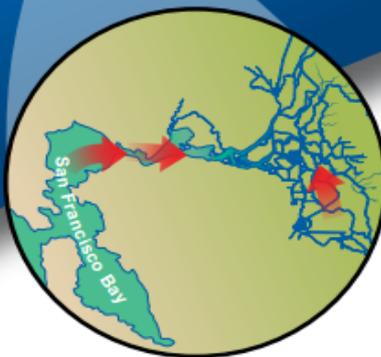

GROUNDWATER

Lower water tables due to hydrologic changes and greater demand cause some shallow wells to go dry.

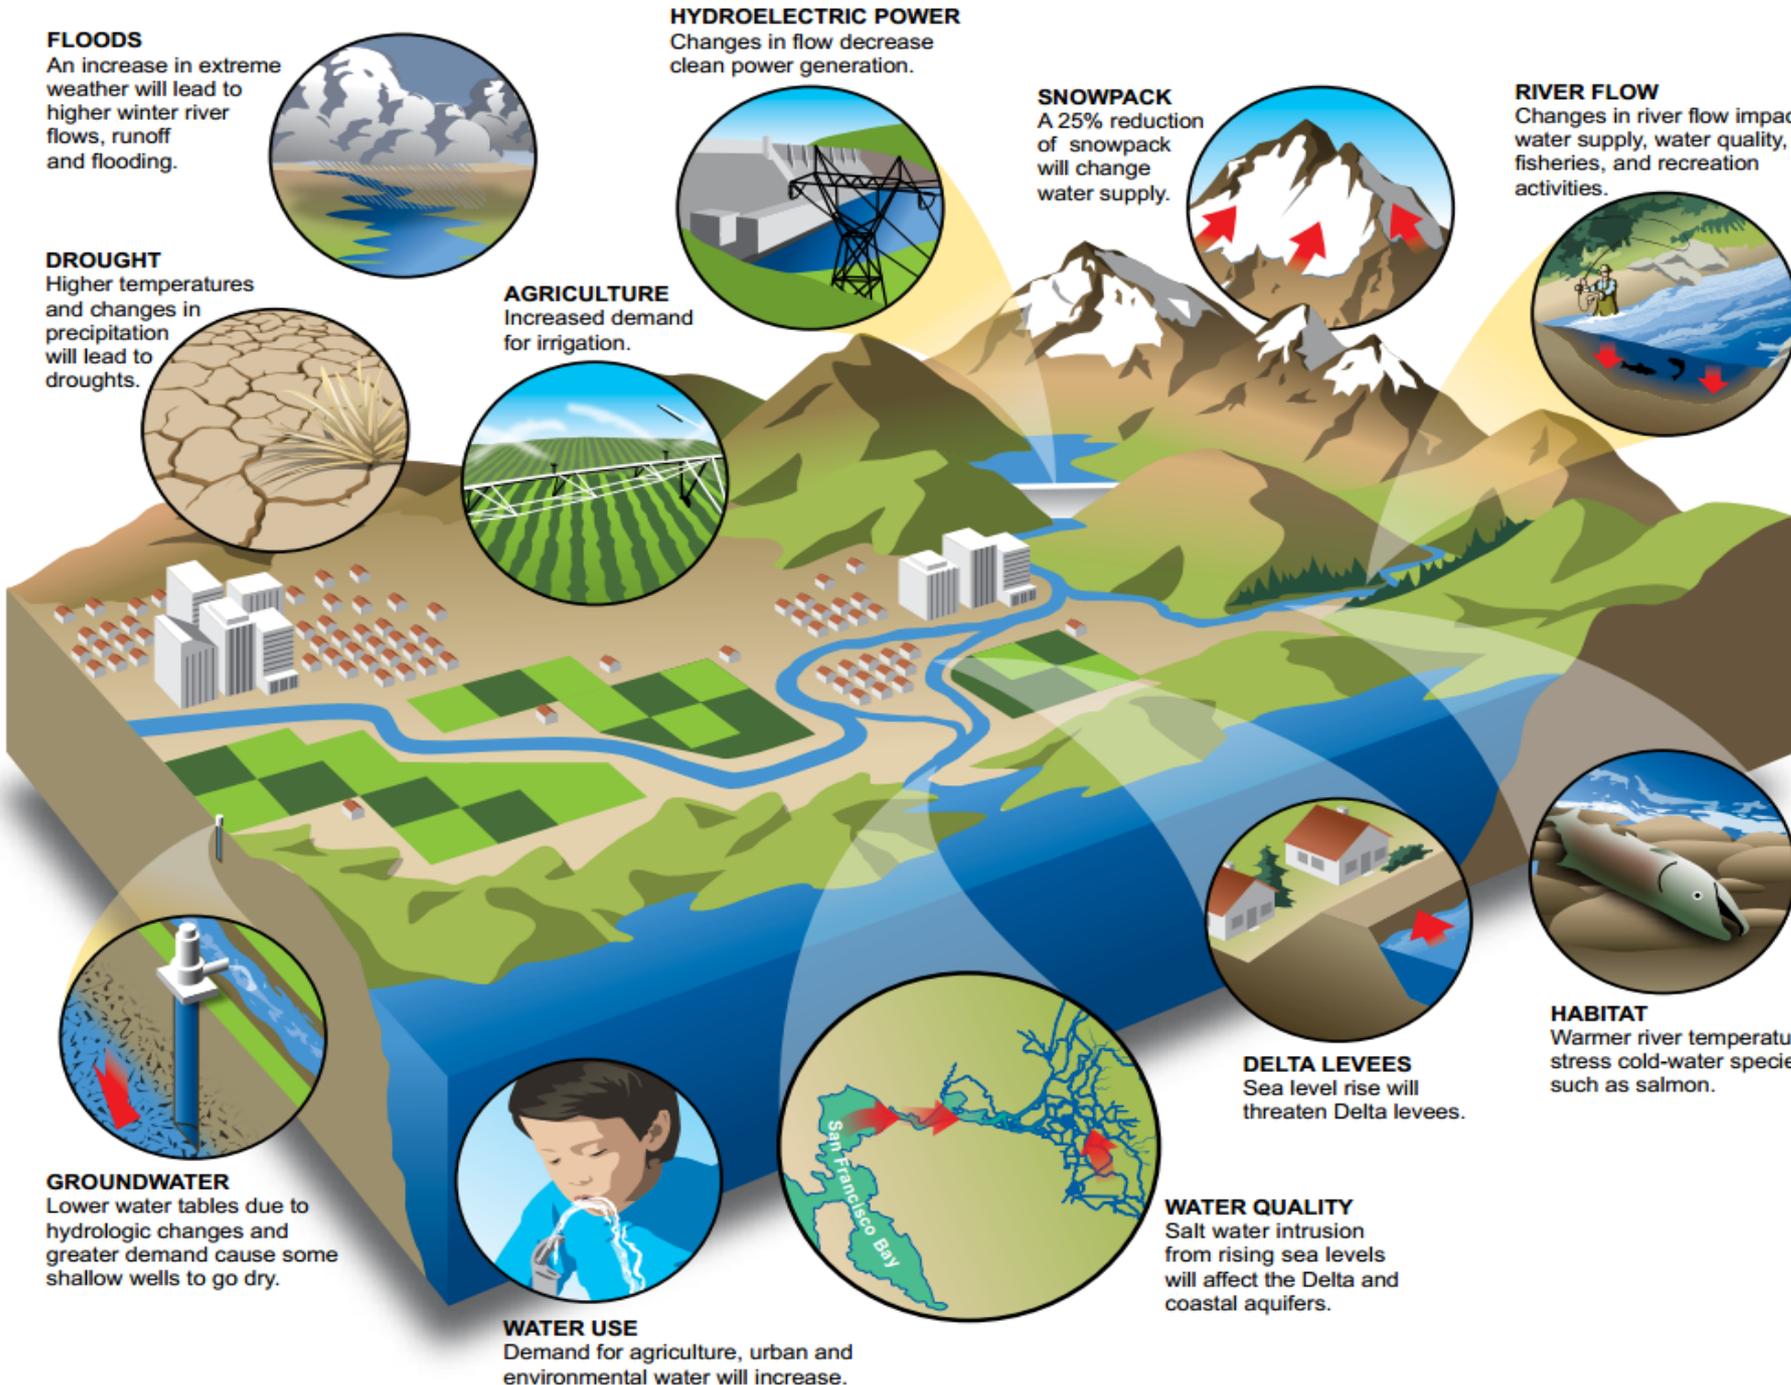

WATER USE

Demand for agriculture, urban and environmental water will increase.

WATER QUALITY

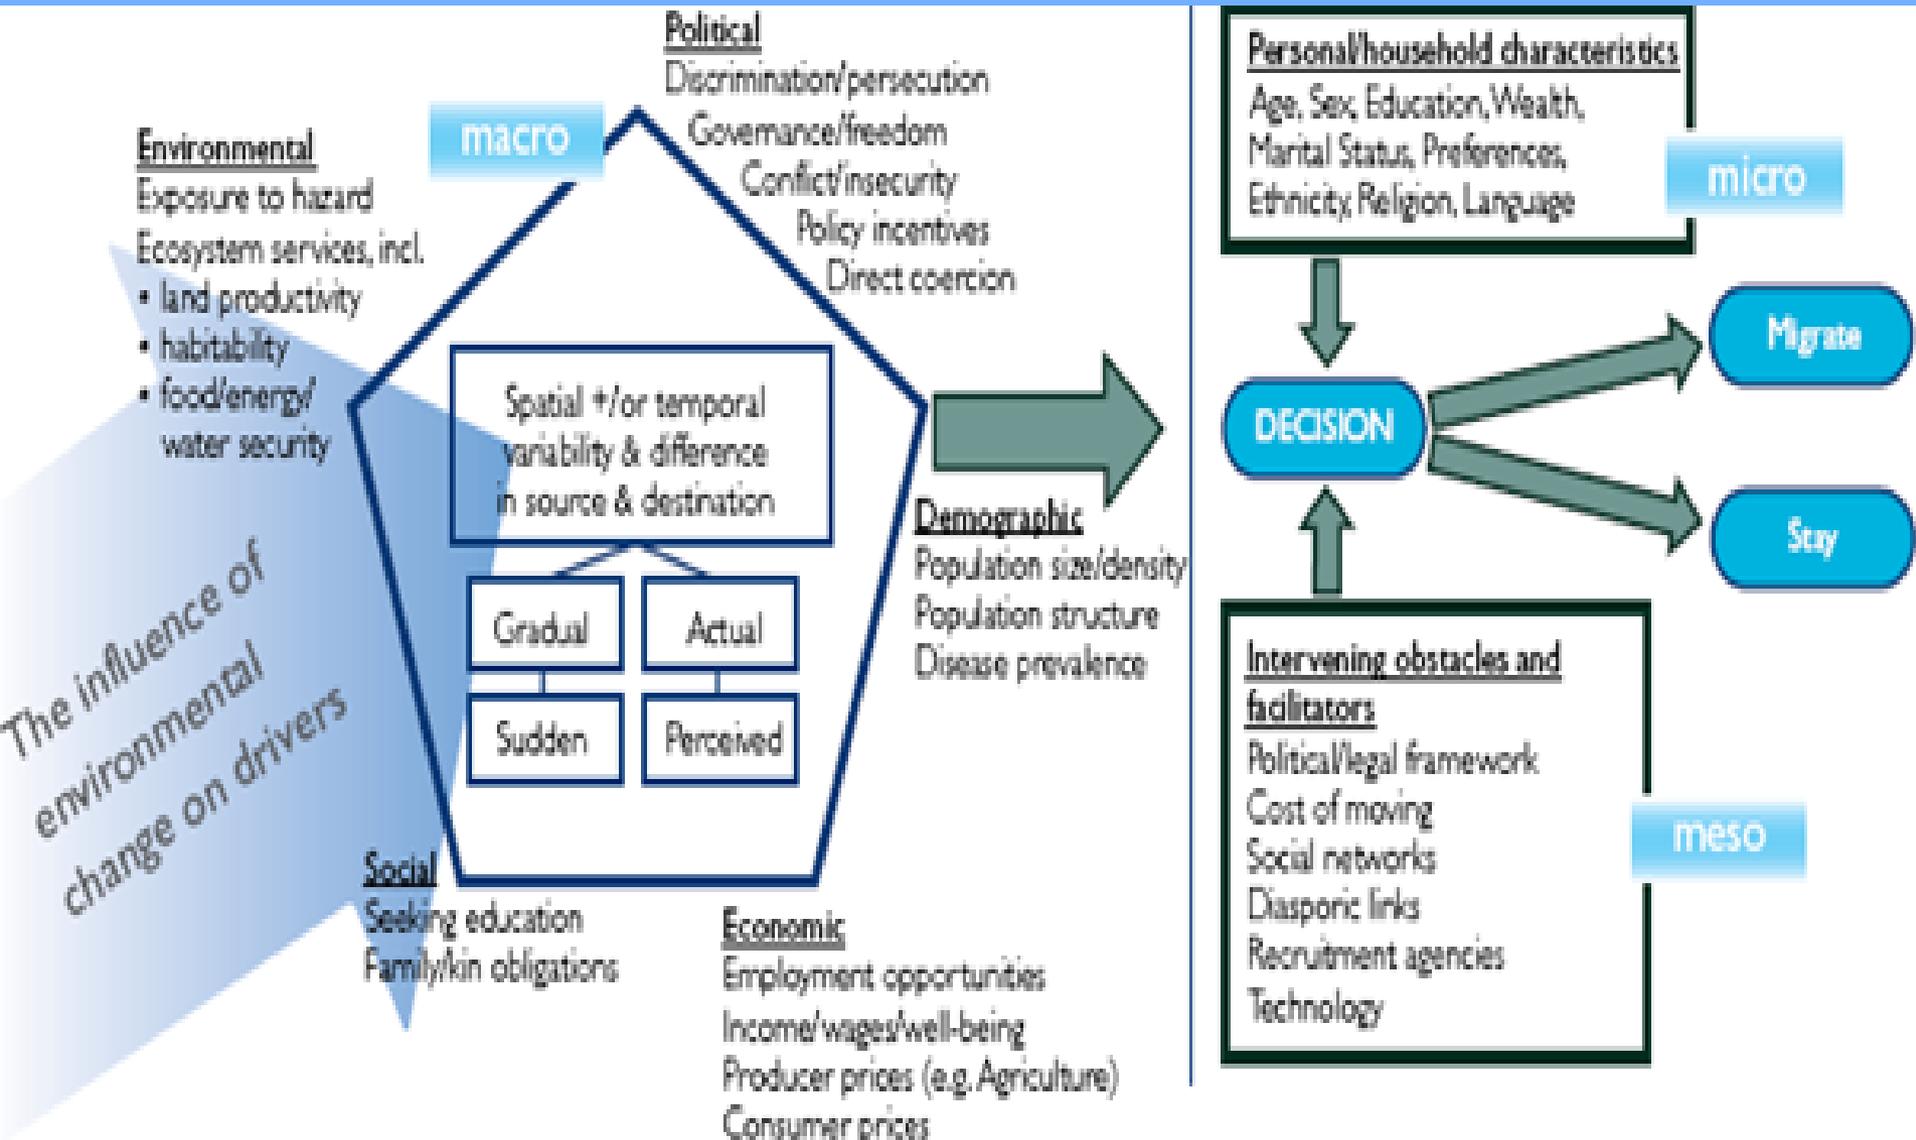

Salt water intrusion from rising sea levels will affect the Delta and coastal aquifers.

8. Paradigm shift: from an occidental to a HUGE resource sharing

Migration as an adaptation?

Empowerment of women

1. Women get better trained
2. Are no sold for marriage when 12 years old
3. Learn hygiene and childrearing
4. Have access to anticonceptive drugs
5. Get precarious health access
6. Income insufficient to survive
7. No money to pay electricity and water supply
8. Change to protestant churches
9. Take antidepressive drugs to support the social and family pressure
10. Some get involved in local policy due to lack of men

- **From a human security perspective a bottom-up and top down resilience-building with mitigation and adaptation reduce the threats from disasters.**
- **A human security perspective focuses on the consequences of climate change through preventive behavior, early warning and training**
- **The integrated DRR and DRM is not related to the militarization of climate change but supports a sustainable development process with DRR and DRM.**
- **A proactive climate change security combines mitigation, adaption and resilience-building and takes preventively into account the social and environmental vulnerability.**

The shell (*caracol*) model for a sustainability transition: a cultural challenge

- is a **globally organized way** of life based on values, norms, beliefs, institutions and productive processes including the development of science and technology
- is **transmitted from generation** to generation by formal and informal processes
- is a **learning process** which includes acculturation and enculturation
- not based on natural laws but **socially constructed**: interests maintain and reinforce structures of power and mechanisms of control
- is so **deeply internalized** that it is perceived by the people as natural
- **cultural products** are shared by members of a society; they link people together due to identity patterns and social representations
- **cognition process** legitimized **deep structures of beliefs** and behavior of complex relationship, interdependence between progressive destruction of natural - human systems
- Individuals & social actors, institutions, regimes, and worldviews require **fundamental change** from **cornucopian view** to complex and **sustainable biological-human system** (EZLN, indigenous movement in Mexico).

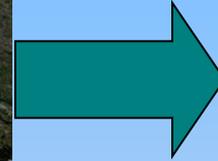

Alternatives: Water harvesting, Nasca, Peru

How to produce sustainable alternatives of water harvesting and water saving technologies with gender perspective?

Changes in consumption patterns

The increase in energy consumption is not just more of the same . . .

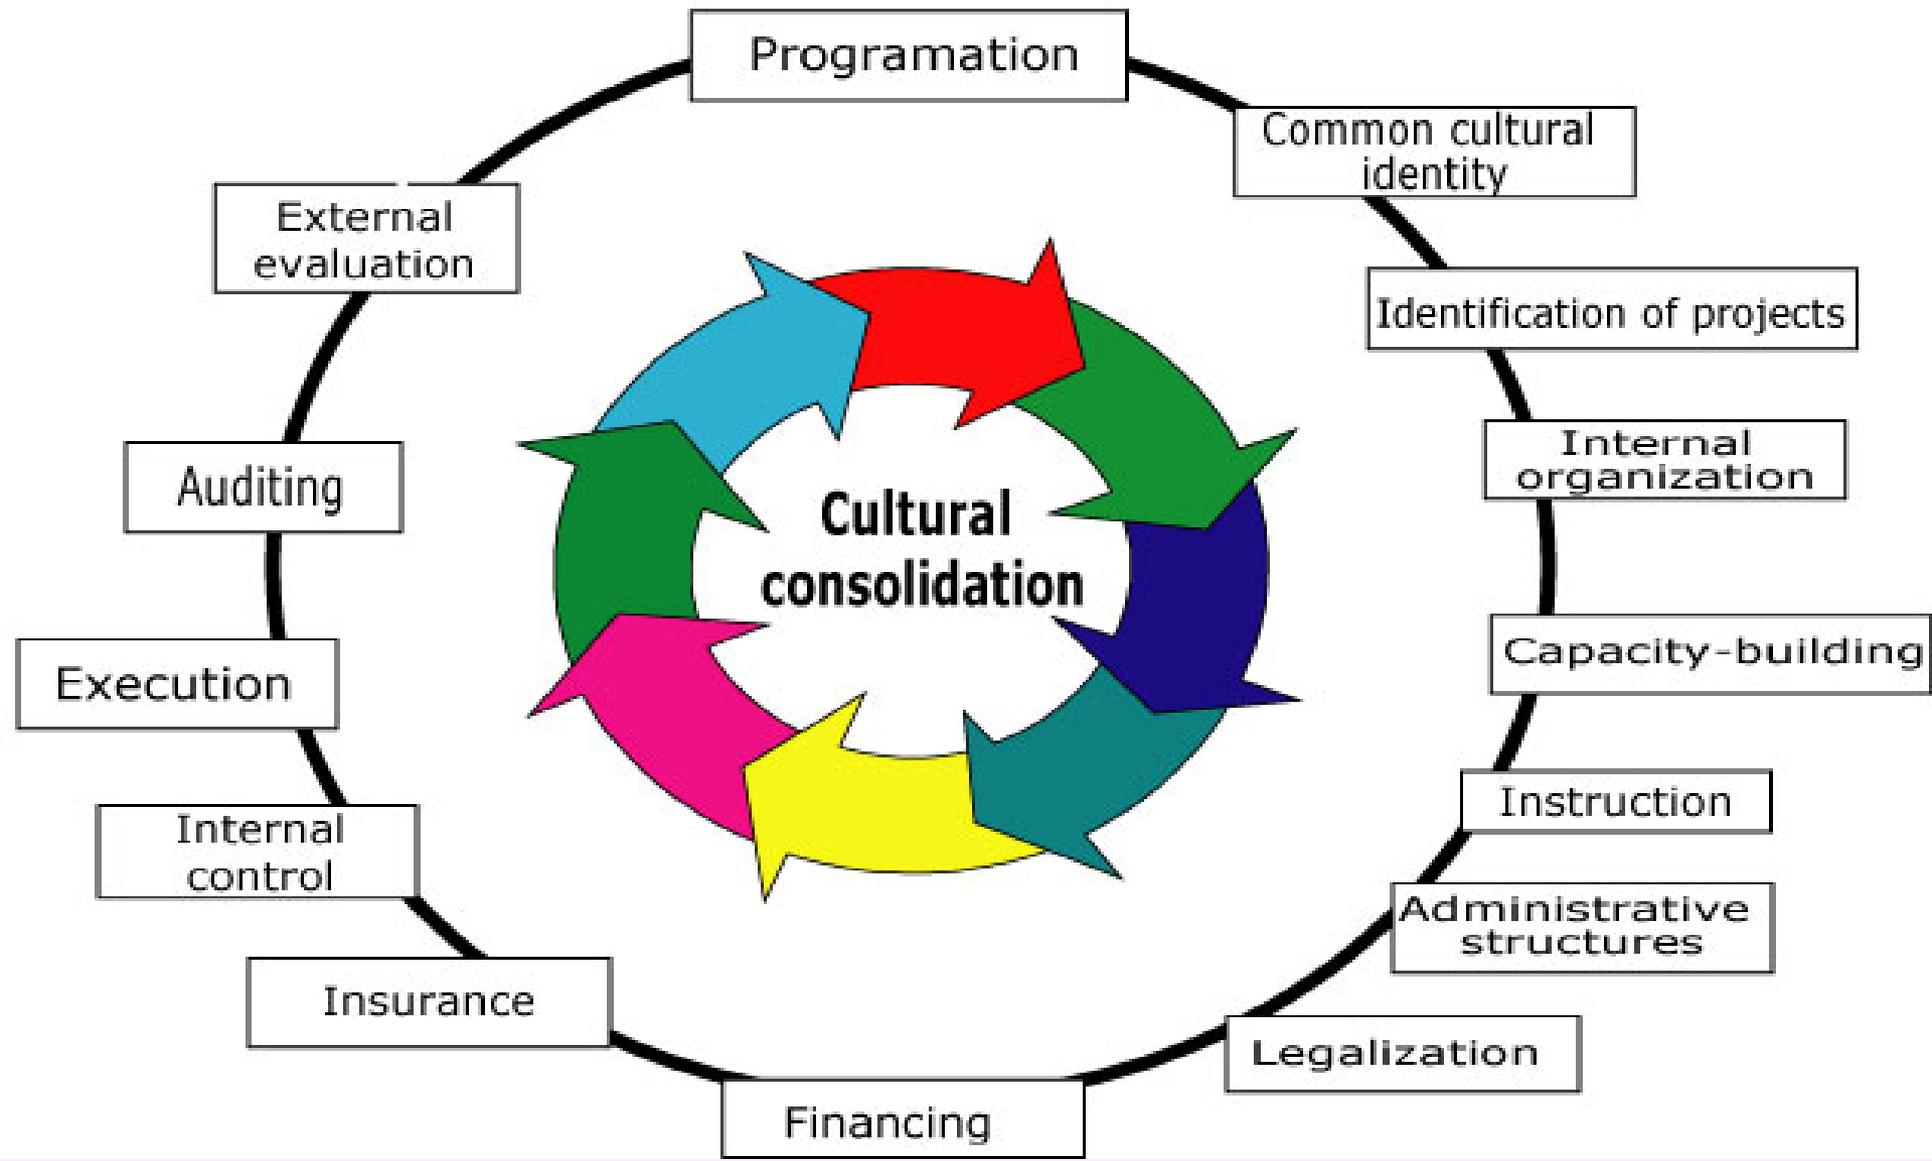

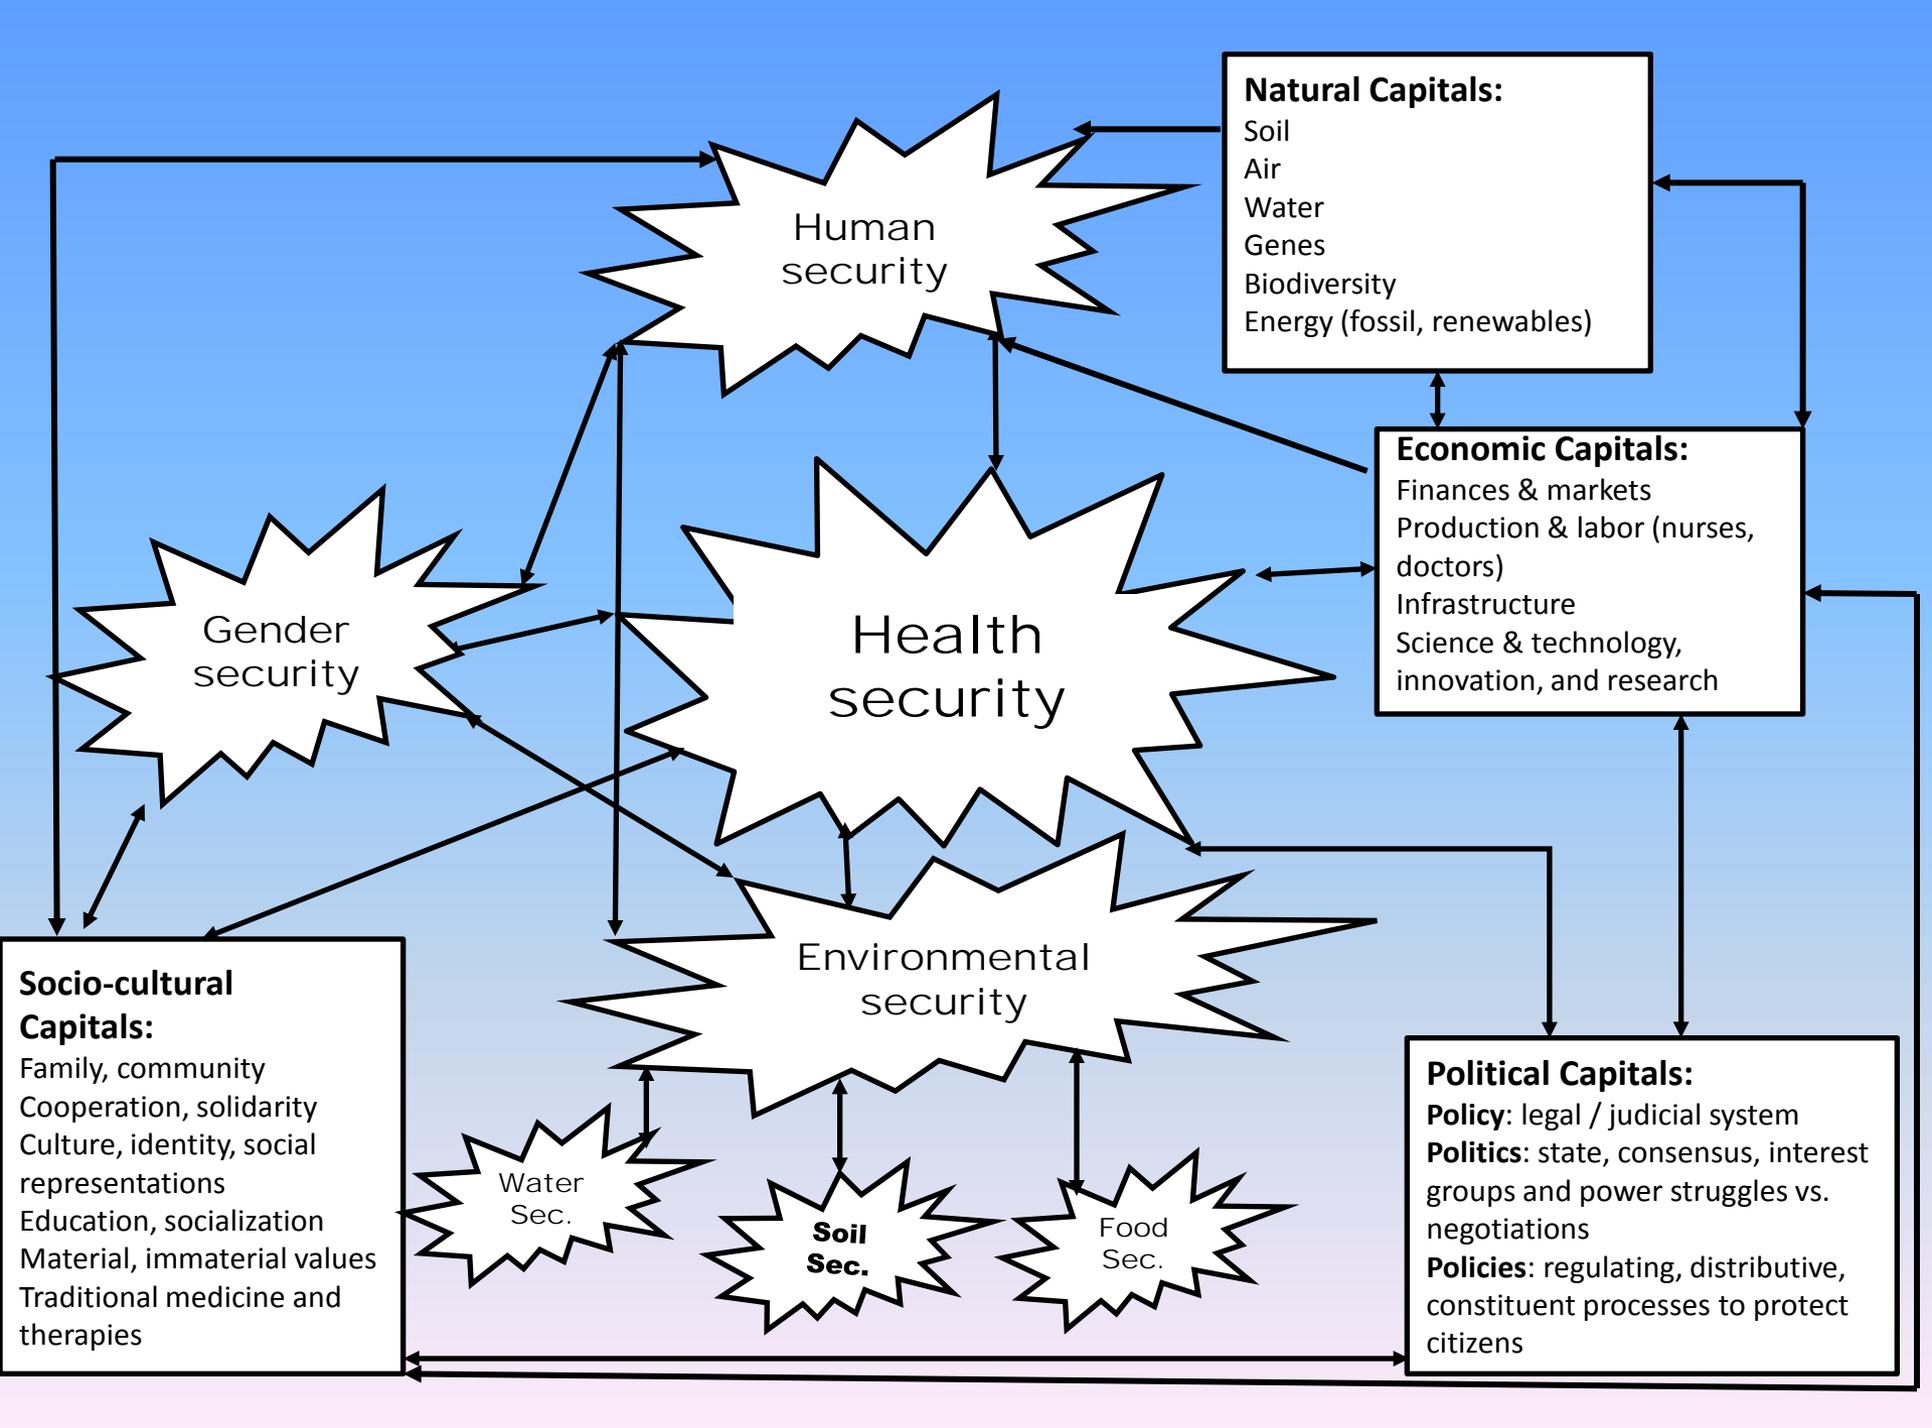

The household changes its metabolic pattern co-evolving with the rest of the economy – this implies a coordinated change in the pattern of goods and services **produced** \leftrightarrow **consumed**
